(57) **ABSTRACT**

Methods and devices for selectively presenting a user interface or “desktop” across two devices are provided. More particularly, a unified desktop is presented across a device and a computer system that comprise a unified system. The unified desktop acts as a single user interface that presents data and receives user interaction in a seamless environment that emulates a personal computing environment. To function within the personal computing environment, the unified desktop includes a sleep state where both the device and computer system become inactive. The unified desktop may be awakened by one of numerous actions by the unified system or the user. Awakening the unified desktop is governed by a set of rules that are associated with the state of the unified system.
